

1. Accepted pair decisions

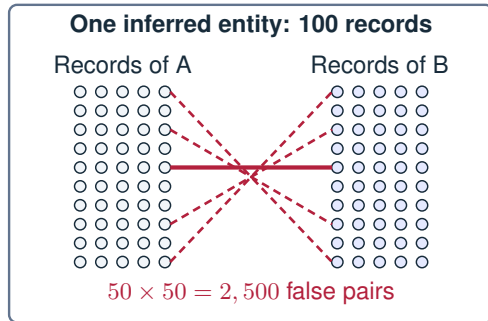

Accepted edges

2,451 accepted pairs; 1 false pair

Pair precision: $2,450/2,451 = 99.959\%$

2. Connected-components result

Pairs implied by the component

4,950 co-clustered pairs; 2,500 false

Pair precision: $2,450/4,950 = 49.495\%$

Illustrative. All 2,450 true within-entity pairs are accepted. The groups compress those edges. Dashed red lines illustrate implied false relationships. A merge of groups of sizes n_1 and n_2 asserts $n_1 n_2$ cross-group relationships.
